

Showcase 1: Strongest Black-box Patch Effect

01bbf47b

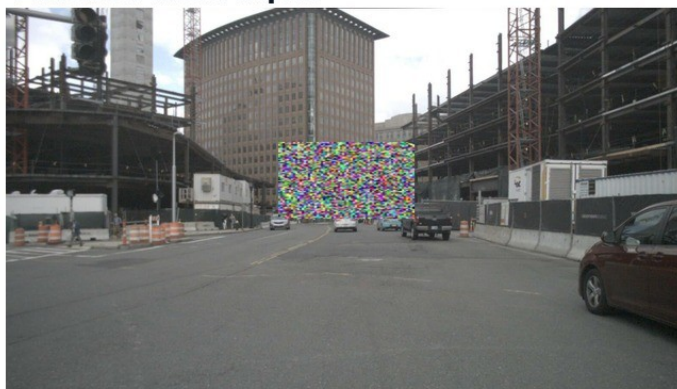

Horizon-center patch on front camera causes a large final trajectory deviation.

Black-box: front camera only | no gradients | position sweep | trajectory-shift objective

Clean front input

Patched front input

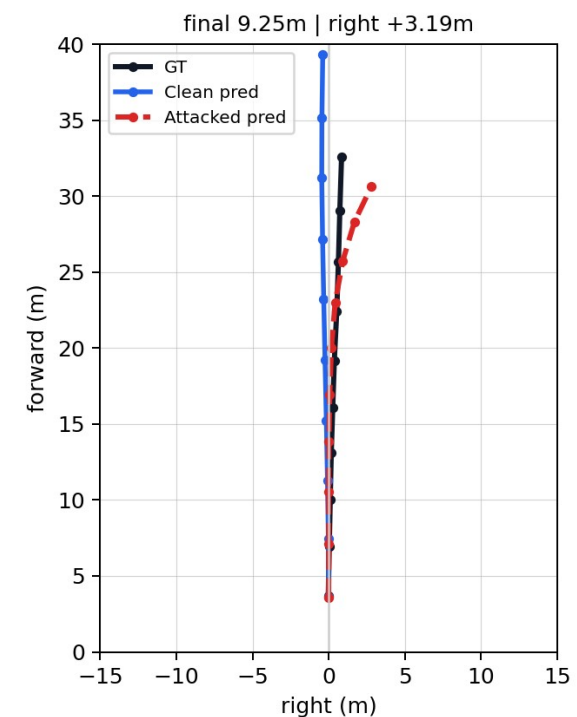

Input observation: clean front image vs patched front image

final **9.25m**

right **+3.19m**

mean **3.44m**

Clean prediction goes straight; attacked prediction shifts right and slows/shortens the planned path.

Trajectory overlay: GT / clean pred / attacked pred

Showcase 2: Scene-aware Placement Helps

01a7d01c

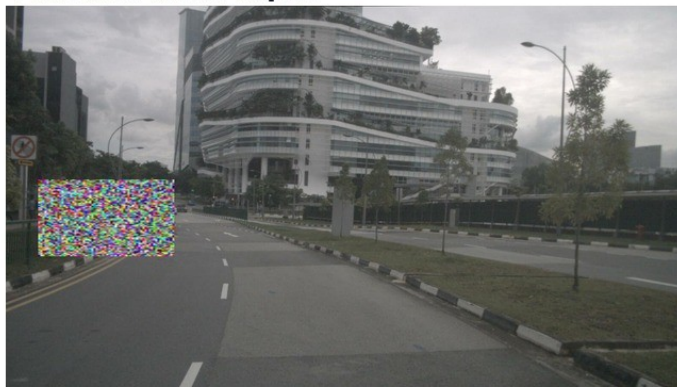

Patch is placed on a salient construction/roadside cue selected from the front image.

Black-box: front camera only | no gradients | position sweep | trajectory-shift objective

Clean front input

Patched front input

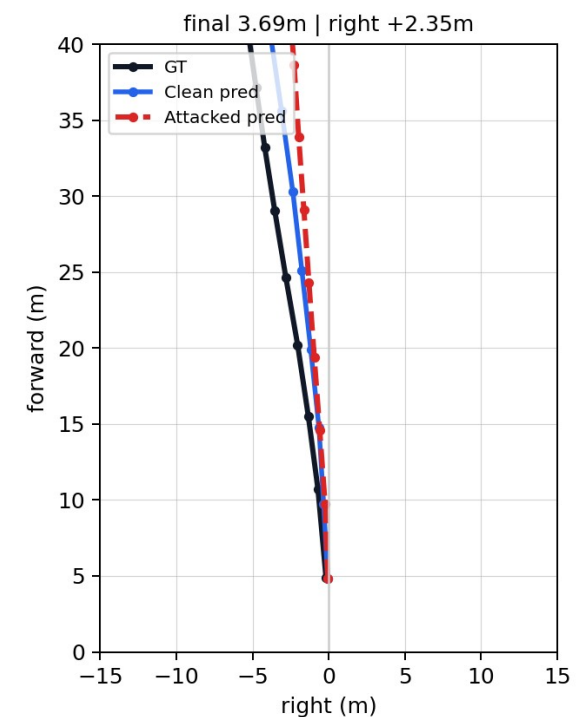

Input observation: clean front image vs patched front image

final **3.69m**

right **+2.35m**

mean **1.47m**

Compared with fixed placement, scene-aware placement increases final shift from 1.31 m to 3.69 m.

Trajectory overlay: GT / clean pred / attacked pred
